Ammonia and amino acid metabolism in Escherichia coli following H₂O₂ stress. ROS are major chemical reactive oxygen species generated in the cells under stress conditions. ROS-generated damages are counteracted by antioxidants. During oxidative stress, ROS can readily react with proteins, nucleic acids and lipid structures. In this study, we investigated the metabolic changes of proteins and some amino acids in the Escherichia coli cell under H₂O₂ stress. We found that the levels of GSSG and GSH decreased, while the ROS level increased in response to H₂O₂ treatment. Furthermore, protein carbonyl content increased with treatment time, indicating increased protein oxidation in E. coli. Proteins including GAPDH, RpoA and EF-Tu were involved in the redox state regulation during H₂O₂ stress. Several proteins were downregulated by H₂O₂ treatment and may be involved in response to oxidative damage. The decreased level of the essential amino acids alanine, threonine and methionine indicated a possible amino acid mis-incorporation in protein synthesis under H₂O₂ stress. This study may provide novel insights into H₂O₂ stress response in the cell.

Q: Setting field in a data file to a specific value in a google apps script I have a Google Forms that my organization has created. I have a very basic google app script that opens the form, pulls the form values into a spreadsheet, creates a new sheet, and then sends a message to the contact form. This works fine. What I want to do is set a specific field in the form to a specific value. The form is rather large, so I don't want to create a new form for this. Instead, I want to set a field (in this case a dropdown) to a specific value. Is there any way to do this? This is the code I have so far: `function sendFormMail() { var ss = SpreadsheetApp.getActiveSpreadsheet(); var form = FormApp.openById('xxxxxxxxxxxx'); var formValues = form.getAllResponseValues(); var formData 82157476af`
